Gene (1995) 152:103-106
A gene from the hyperthermophile Pyrococcus furiosus whose deduced product is homologous to members of the prolyl oligopeptidase family of proteases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 #domain signal sequence (fragment) #status predicted #label SIG;

C. I. FUNCTION: CYTOCHROMES P450 ARE A GROUP OF HEME-THIOLATE
MONOOXYGENASES. IN LIVER MICROSOMES, THIS ENZYRE IS INVOLVED IN AN UNDAH-DEPENDENT ELECTRON TRANSPORT. IT OXIDIZES A VARIETY

OF STRUCTURALLY UNRELATED COMPOUNDS, INCLUDING STEROIDS, FATTY

C. I. CATALLYTIC ACTIVITY: RH + REDUCED FLAVOPROTEIN + O(2) = ROH +

C. CATALLYTICA ACCATION: HEMBRANE-BOUND.

C. I. SUBCELLICAR LOCATION: MEMBRANE-BOUND.

C. I. SUBCELLICAR LOCATION: MEMBRANE-BOUND.

C. I. SUBCELLICAR LOCATION: MEMBRANE-BOUND.

C. I. SIMILARITY: BELONGS TO THE CYTOCHROME P450 FAMILY.

C. I. SIMILARITY: GOUND IN LUNG AND LIVER.

C. I. SIMILARITY: GOUND IN LUNG AND LIVER.

C. I. SIMILARITY: BELONGS TO THE CYTOCHROME P450 FAMILY.

-!-CATALTIC ACTIVITY: ENDOHYDROLYSIS OF THE N-GLYCOSIDIC BOND AT ONE SPECIFIC ADENOSINE ON THE 288 RRNA.
-!- SUBUNIT: THE SHIGA-LIKE TOXINS CONTAIN A SINGLE A SUBUNIT AND MULTIPLE COPIES OF A B SUBUNIT.
-!- SIMILARITY: TO OTHER BACTERIAL AND PLANTS RIBOSOME-INACTIVATING PROTEINS.

                                                                                                                                                                                                                                                                               The more of the property of the property of a minimal against metanoma.

The munimal against melanoma.

The immunise animal against melanoma.

Claim 55: Page 131: 184pp: English.

The immunogenic paptide is derived from cDNA25 (R84854), a melanoma antigen derivative of gp100 (see R84855). The peptide and its derivative of gp100 (see R84855). The peptide and its derivative of pp100 (see R848251) are used in medicaments (vaccines) for the treatment or prevention (by immunization) of melanoma. Antibodies against melanoma-specific antigens and its immunogenic peptides may be used in the detection and isolation of the antigen from a sample, the detection of which is indicative of a disease state

(melanoma or metastatic melanoma).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1; Page 22-24; 40pp; English.

Immunogenic peptides derived from the melanoma associated antigen may be used in the production of vaccines. Nucleotide sequences encoding the immunogenic peptides may be used as primers and probes in the detection of melanoma cells. Tumour infiltrating lymphocytes capable of binding to the melanoma associated antigen can be cultured ex vivo and returned to melanoma particles, and when readiolabelled, they may be used to identify tumour deposits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Claim al; Fig 7A; 184pp; English.

Papl00 is a melanocyte-melanoma-specific antigen (MART-1) which is recognized by T-lymphocytes, and is a derivative of the melanoma-specific antigen CDNA25 (see R84854). gpl00 is a source of immunogenic peptides which are optionally modified to enhance their binding to a MHC molecule, and used in medicaments, especially vaccines, for the treatment or prevention (by immunisation) of melanoma. Antibodies against conval and isolation of the antigen from a sample, the detection of which is indicative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA encoding melanoma antigens recognised by T-lymphocytes - also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cDNA25; MART-1; melanoma antigen recognised by T-cell;

                                                                                                                                   DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

Claim 81, F19 5A: 184pp; English.

Claim 81, F19 5A: 184pp; English.

CDNA2 is a melanoma antigen (MART-1) which is recognized by an elanoma antigen (MART-1) which is recognized by a pecific antigen spilou (see R84199). Antigen coptains a source of immunogenic peptides (see R84199) which are optionally modified used in medicaments, especially vaccines, for the treatment or prevention (by immunisation) of melanoma. Antibodies against cDNA2 and its immunogenic peptides may be used in the detection and isolative of a disease state (melanoma or metastatic melanoma).

Claim 8; Page 88: 138pp; English.
R80521 is the rat allograft inflammatory factor, AIF-1. The AIF-1
gene is a differentially expressed allograft gene which is expressed
in allograft tissue during transplant rejection. Identification of
the rat AIF-1 product or transcript indicates that allograft
rejection is taking place. The rat AIF-1 gene and product are
therefore useful in the diagnosis of transplant rejection
The diagnostic methods used allow rejection (vascular inflammation)
to be detected at an early stage and require only a small amount of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Claim 1; Columns 41-44; 31pp; English.
071560 encodes R60618 the murine type II interleukin-1 (IL-1)
receptor isolated from the 702/3 cell line. This protein along with a suitable diluent and carrier forms a therapeutic composition, which can be used to suppress IL-1 dependent immune responses in humans. The soluble protein can also be used in the clinical treatment of autoimmune diseases, such as rheumatoid arthritis, diabetes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Nucleic acid encoding very low density lipoprotein receptor - used to develop prods. for treating e.g. hyperlipidaemia for screening assays and for diagnostic imaging Claim 2; Page 44; 59pp. English.

This protein may be expressed recombinantly in a transgenic animal. By elevating levels of a VLDL receptor in an animal, the receptors will aid in removal of circulating VLDL and related lipoproteins to decrease the risk of developing coronary diseases. It may be used in the treatment of e.g. hyperlipidaemia, atherosclerosis or hypercholesterolemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           specified aminoacid in protein claim 1, page 7; 14pp; Japanese.
Claim 1, page 7; 14pp; Japanese.
The sequence shows an apo-E lipoprotein receptor. The gene was isolated from a cDNA library extracted from liver, heart and spleen of a normal rabbit. The gene was cloned and expressed in G418-resistant cells. Positive clones were isolated by testing their beta-very LDL binding activity. Transfected cells showed LDL and VLDL binding activity. The receptor has high tissue specificity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Rabbit apo-E lipoprotein receptor - with DNA sequence coding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bullogically active Type II interleukin-1 receptor - useful for suppressing allo-antigen induced immune responses e.g. skin graft, and treatment of auto-immune dysfunction(s) e.g. diabetes
Claim 1; Column 39-44; 28pp; English.
Mouse type II (B-cell) interleukin-1 receptor (IL-IR) precursor (R85481) is the product of a CDNA clone (T05727) obtd. from a CDNA library prepd. from pre-B cell line 702/3 (ATCC TIB 158). Soluble mative or recombinant IL-IR (amino acids 1 to 342-397, inclusive, of the mature protein) is used in the assay of type II IL-IR, in raising antibodies to type II IL-IR, in add to suppress alloantigen sequence 410 AA;

                                                                                                                                                                                                                                                                                                                             New recombinant DNA encoding high mol.wt. Clostridium histolyticum collagenase - e.g. for releasing cells from tissue or treating slipped discs bisclosure; page 36-41; 64pp; English.

A collagenase gene was identified in a pRK290 library containing C. histolyticum ATCC 21000 DNA. The insert was placed in opposite orientations in pCT6 and pCT7, serially delated and sequenced (Q54844). The gene was incorporated into a plasmid vector for expression in a host cell, esp. Escherichia coli. Recombinant collagenase (R5279) is 25-100% more active than native collagenases, and can be used for any application in which tissue digestion is required. Termination signal Q54845 is located il bp downstram of the translation terminator, and consists of a stem-loop structure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Blood; group; determinant; antigen; erythrocyte; oligosaccharide; glycoconjugate; glycosphingolipid; glycoprotein; glycosyltransferase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  isolated DNA molecules - encode human histo-blood groups A-, B- and O-glycotransferases
Example 9; Figure 10; 63pp; English.
The histo-blood group ABH determinants are major allogeneic antigens in both erythrocytes and tissues of humans. They generally constitute peripheral parts of the oligosaccharide chains of glycoconjugates i.e.linked to lipids (glycosphingolipids) or to proteins (glycoproteins). It was proposed that the A and B phenotypes were associated with glycosyltransferases that converted the Hubstance associated with the O phenotype to A and B respectively, through the addition of alphal-3-N-acetylgalactosamine or alphal-3-galactosyl residues to the H antigen Fuc-alphal-2gal-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New DNA sequences encoding enzymes involved in biotin biosynthesis-isolated from Bacillus sphaericus, and transformants useful in fermentative blotin production.

Disclosure: pp: French.

DNA was isolated from B.sphaericus IFO 3525, cut with HindIII and the fragments sub-cloned into pBR322. The recombinant plasmids were used to transform E.coli blo-mutants. Plasmid pTG148 was present in one clone (E.coli GGO GNCM I-GO) which showed complementation for bio C and bio F. The plasmid contains a 4.53%b insert
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Blood; group; determinant; antigen; erythrocyte; oligosaccharide; glycoconjugate; glycosphingolipid; glycoprotein; glycosyltransferase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         B and bio A. The insert present in the plasmid of this clone and the 4.3kb insert from pTG1400 were cloned together in pBR322 to produce plasmid (pTG1440) which complements biotin auxotrophy in a bio delta
                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Features Table.
A second clone was isolated which contained DNA encoding bio D. bio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Transformed cells are used to produce biotin by culture in a medium conty pimelic acid and/or biotin vitamer. Co-culture of two transformants is preferred where one synthesises the vitamer from pimelic acid and the other converts the vitamer to biotin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
         ø
betal-R. Hence, the primary products of the histo-blood group and B genes are the respective glycosyltransferases. The full sequence of the human transferase A is described in R57011. Sequence 195 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                04-DEC-1990 (first entry)

```
As authors translated the codon GAT for residue 110 as As and TGG for residue 256 as Tyr Acinetobacter calcoaceticus RAG-1 has the ability to grow on simple triglycerides such as triacetin; mutants defective in esterase lose this ability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S.; Sato

Mean 23.690; Variance 23.676; scale 1.001 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- FUNCTION: BINDS VLDL AND TRANSPORTS IT INTO CELLS BY ENDOCYTOSIS.
IN ORDER TO BE INTERNALIZED, THE RECEPTOR-LIGAND COMPLEXES MUST
FIRST CLUSTER INTO CLATHRIN-COMPED PITS.
-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-!- TISSUE SPECIFICITY: ABUNDANT IN HEART, MUSCLE, AND ADIPOSE
                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

ENGCINGLY BINDS VLDL AND TRANSPORTS IT INTO CELLS BY ENDOCYTOSIS.

IN ORDER TO BE INTERNALIZED, THE RECEPTOR-LIGAND COMPLEXES MUST.

C. 1- FUNCTION: BINDS VLDL AND THE RECEPTOR-LIGAND COMPLEXES MUST.

C. 1- STREAT LOYAR LOCATION: TYPE I MEMBRANE PROPEIN.

C. 1- TISSUE SPECIFICITY: ABUNDANT IN HEART AND MUSCLE; LESS IN KIDNEY,

BRAIL, OVARY: TESTIS, LUNG, ADIPOSE TISSUE.

C. 1- SIMILARITY: CONTAINS 8 LDL-RECEPTOR CLASS B DOMAINS.

C. 1- SIMILARITY: CONTAINS 6 LDL-RECEPTOR CLASS B DOMAINS.

C. 1- SIMILARITY: CONTAINS 3 EGF-LIKE DOMAINS.

C. 1- SIMILARITY: CONTAINS 3 EGF-LIKE DOMAINS.

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Melanoma-specific immunogen comprises epitope(s) homologous with pmel.17 - are highly potent stimulators of HLA-A2+CTL's useful in adoptive immuno-therapy

Example 8; Page 52; 148pp; English.

A melanoma-specific immunogen homologous with pMel-17 comprises one con more CTL (cytotoxic T lymphocyte) epitopes from the group R82098-cor more CTL (cytotoxic T lymphocyte) epitopes from the group R82098-cor more CTL (cytotoxic T lymphocyte) epitopes from the group R82098-cor more CTL (cytotoxic T lymphocyte) epitopes from the group R82098-cor more CTL (cytotoxic T lymphocyte) epitopes R82098-cor more CTL (cytotoxic T lymphocyte) epitopes R82098-cor more CTL (cytotoxic T lymphocyte) epitopes R82098-cor marmals against melanoma peptides which are comparable of all to fine and can be used in immunotherapy or incorporated into immunogenic conjugates as vaccines.

A melanoma-specific immunogen homologous with pMel-17 comprises one
or more CTL (cytotoxic T lymphocyte) epitopes from the group R82098-
R82194 capable of eliciting a CTL response. The epitopes R82098-
R82108 are of particular interest. The immunogen can be used for
partial protection in mammals against melanoma peptides which are
homologous with pMel-17 are highly potent stimulators of HIA-A2+
CTLs in several cell lines and can be used in immunotherapy or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

pMel.17 - are highly potent stimulators of HLA-A2+CTL's userul in adoptive immuno-therapy Example 8; Page 53, 148pp; English.

A melanoma-specific immunogen homologous with pMel-17 comprises one or more CTL (cytotoxic T lymphocyte) epitopes from the group R82098-R82194 capable of eliciting a CTL response. The epitopes R82098-R82108 are of particular interest. The immunogen can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA encoding melanoma antigens recognised by T-lymphocytes - also vectors, host cells and antibodies, used to detect, treat and immunise animal against melanoma.

of immunogenic peptides (see R84199) which are optionally modified (see R84200-R84211) to enhance their binding to a MFC molecule and used in medicaments, especially vaccines, for the treatment or prevention (by immunisation) of melanoma. Antibodies against CDNA2 and its immunogenic peptides may be used in the detection and isolation of the antigen from a sample, the detection of which is indicative of a disease state (melanoma or metastatic melanoma).

Claim 81; F19 7A; 184pp; English.

gp100 is a melanocyte-melanoma-specific antigen (MART-1) which is recognized by T-lymphocytes, and is a derivative of the melanoma-specific antigen CDNA25 (see R84854). gp100 is a source of immunogenic peptides which are optionally modified to enhance their binding to a MHC molecule, and used in medicaments,

A melanoma specific immunogen homologous with pMel-17 comprises one or more CTL (cytotoxic T lymphcyte) epitopes from the group R82098-882194 capable of eliciting a CTL response. The epitopes R82098-R82108 are of particular interest. The immunogen can be used for partial protection in mammals against melanoma peptides which are homologous with pMel-17 are highly potent stimulators of HLA-A2+CTLS in several cell lines and can be used in immunotherapy or incorporated into immunogenic conjugates as vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 1; Page 22-24; 40pp; English.
Immunogenic peptides derived from the melanoma associated antigen
may be used in the production of vaccines. Nucleotide sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Melanoma-specific immunogen comprises epitope(s) homologous with pMel.17 - are highly potent stimulators of HLA-A2+CTL's useful in adoptive immuno-therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Melanoma associated antigen gp100 - used in vaccines and for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Melanoma-specific mutant immunogen epitope 9mer peptide.

New CDNA probe for detecting meth:enyl:tetra:hydro:folate
synthetase - to assess usefulness of 5-formyl:tetra.hydro:folate
synthetase - to assess usefulness of 5-formyl:tetra.hydro:folate
for treating cancer in conjunction with 5-fluoro:uracil
bisclosure; Figure 2; 14pp; English.
Human liver MYHES was purified to homogeneity. Purified enzyme was
chemically cleaved with cyanogen bromide (CDBr) and enzymatically
digested by protease V8. A sequence of only six Aas (R66943) could
consider from one of the CDBr fragments due to the small
amounts of the purified protein left after purification and was
used for MTHFS CDNA cloning. Degenerate oligos corresp. to a
mounts of the purified protein left after purification and was
used for MTHFS cDNA cloning. Degenerate oligos corresp. to a
conseptide were used to amplify a 389 cDNA prepd. from human
liver poly(A)+ using a 3' RACE (R66944) protocol. The PCR product
was subcloned and sequenced and found to contain nts corresp. to
content used as a probe to screen the lambda DR2 human liver CDNA
library and a clone of 867 bp was obtd. (see Q84626). The
content contains two sequenced peptides obtd.
from purified MTHFS protein (see I and II FT); an ATP consensus
binding site (see III FT) and 4 consensus putative phosphorylation
sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Recombinant N-myc proto-oncogene - used for producing antibodies and identifying human cancers and for use in cancer therapy.
Disclosure; Fig 1: 31pp; English.
Human cancers, especially neuroblastoma, retinoblastoma and small cell lung cancer, can be identified and monitored immunologically by detecting the N-myc protein. This is useful in cancer diagnosis and cancer therapy. Polypeptides containing at least 6 amino acids of the sequence provided may be used to raise antibodies specific for the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 51; DB 13; Length 164;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents Plasmodium falciparum glucose-6-phosphate dehydrogenase (G6PD). The DNA encoding this sequence was isolated using the primers given in Q38806-07. The amplified sequence was used in the production of transformed E. coli which produce a recombinant P. falciparum G6PD. These transformed cells can be used in a method of screening drugs for activity against P. falciparum G6PD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                              Polymerase chain reaction; glucose-6-phosphate dehydrogenase; PCR; E. coli; G6PD; drug; transformation; primer; amplify. Plasmodium falciparum.

To contagnosis and therapy, e.g. for treating tumours or promoting wound healing

Claim 6; Columns 47-50; 44pp; English.

Claim 6; Columns 47-50; 44pp; English.

Claim 6; Columns 47-50; 44pp; English.

Contagions within the CDNA encoding a murine activin receptor, human and porcine TGF-beta type II receptor and the daf-1 receptor, human and porcine TGF-beta type II receptor and the daf-1 receptor, human and porcine TGF-beta type II receptor and T36073) were used for amplifying clones present in a 14.5 day foetal rat urogenital ridge CDNA COS cell expression library. Four clones encoding portions of four novel polypeptides (all putative serine/threonine kinases) were used as probes to compare to the contaginate of 19-23 from these clones were used as probes to isolate full-length cDNA sequences for each of the four TGF-beta type I receptors. Each putative receptor comprises a hydrophobic signal peptide of 19-23 residues, an extracellular, cysteine-rich, hydrophobic single transmembrane domain of 23-25 residues, an intracellular serine/threonine kinase domain of 23-25 residues, an intracellular serine/threonine kinase domain of 23-25 residues, an intracellular serine/threonine rich tail. The present sequence is that of MISR4 which appears to be a functional type II receptor; it requires the presence of a functional type II receptor; it requires the presence of a functional type II receptor; it requires the presence of a functional type II receptor; it requires the presence of a functional type II receptor; it requires the presence of a functional type II receptor; it requires the presence of a functional type II receptor; it requires the presence of a functional type II receptor; it requires the presence of a functional type II receptor; it requires the presence of a functional type II receptor; it requires the presence of a functional type II receptor; it requires the presence of a functional type II receptor; it requires the presence of a functional type II receptor; it requires the presence of a functional sea
                                                                                                                                                   New isolated TGF-beta type I receptor DNA - used to develop prods for diagnosis and therapy, e.g. for treating tumnours or promoting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New receptors of the transforming growth factor-beta receptor family - comprising Mullerian Inhibitory Substance Receptors and inhibin receptors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 57; Fig 4; 59pp; English.

Misrl (049763) is believed to encode an isoform of the rat
MIS receptor. Misr2A/Misr2B (049764), misr3 (049765) and misr4
(049765) are believed to encode monomeric isoforms of the rat
inhibin receptor and/or BMP receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 50; DB 18; Length 501

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This N-myc protein is encoded by the clone N-myc 1, obtained on screening of a human neuroblastoma cDNA library with probe pNB-1. Constitutive polypeptides, within the C-terminal 394 residues of N-myc, are useful for detecting the N-myc proteins. These are esp. useful for distinguishing amongst morphologically similar tumour types and will eg enable early detection of small cell lung cancers. Peptide VI is an antigenic or haptenic polypeptide defining an epitopic site which is immunologically cross reactive with both N-myc and B-myc. Peptides II and III are capable of eliciting antibodies (Abs) for use eg in cancer therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New synthetic polypeptide(s) useful in cancer diagnosis-partic. of neural and neuro-endocrine cancers, are in carboxy region of N-myc protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          30-OCT-1996 (first entry)
Mullerian inhibiting substance receptor MISR4.
Mullerian inhibiting substance receptor; MISR; TGF-beta receptor;
transforming growth factor beta type I receptor; gene therapy;
wound healing; tumour treatment; rat inhibin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Claim 6: Page 24: 63pp; English.
Psf230 protein is administered to humans to prevent transmission of malaria by inducing a transmission blocking immune response. It can also be used to raise antibodies and for T and B cell epitope mapping. Pfs230 induces a high and long-lasting antibody titer and Sequence. 3135 AA;
